The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine Mbol DNA fragments of between 250 and 500 by with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information of opecification and indexed herein (see below). The sequence information specification and indexed herein (see below). The sequences upstream and downstream of the microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp. microsatellite (using the program OPTIPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important traits esp. in cattle, to allow selective breeding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN
                                                                                       Polymorphic bovine DNA markers - used in genetic identification, gene mapping, and selective breeding.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Polymorphic bovine DNA markers - used in genetic identification, gene mapping, and selective breeding.

```
The sequence is that of a bovine microsatellite sequence obtd. by

screening a library of bovine Mbol DNA fragments of between 250 and 500

compared by with an (AF)15 and a (TF)15 oligonucleotide probe. One out of 50

clones cross-hybridised. Assuming independent distribution of

microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites

compared bovine genome is estimated at >100, 000. The sequence information

for ca. 230 such bovine microsatellites is summarised in the

specification and indexed herein (see below). The sequences upstream and

downstream of the microsatellite sequence were used to generate the

required PCR primers for in vitro amplification of the corresp.

microsatellite (using the program OPTIPRIM). The microsatellites may be

microsatellite (using the program OPTIPRIM). The microsatellites may be

concomically important trait loci, or genes involved the determinism of

connomically important traits espi in cattle, to allow selective

breeding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN

required PCR primers for in vitro amplification of the corresp.
microsatellite (using the program OPTIPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important traits esp. in cattle, to allow selective breeding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dC-dA). (dG-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AAT65798-T66047. Those clones where the repeat sequence has been determined are shown in AAT65704-797. This repeat sequence is from the marker clone Mdf18 which contains the repeat sequence is from formula: (AC)18. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Detection of polymorphic genetic markers of the form (dC-dA)n(dG-dT)n using novel nucleic acid mols. as primers.

RESULT

Sequence 36 BP; 18 A; 18 C; 0 G; 0 T; 0 U; 0 Other;

The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n. (dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dC-dA). (dG-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AAT65798-T66047. Those clones where the repeat sequence has been determined are shown in AAT65704-797. This repeat sequence is from the marker clone Mdfill which contains the repeat sequence is from the marker clone Mdfill which contains the repeat sequence laving the formula: (AC)18. (Updated on 25-MAR-2003 to correct PF field.)

The invention relates to a method of identifying or detecting a cucleotide repeat region in a nucleic acid molecule characterised by a cucleotide repeat region in a nucleic acid molecule characterised by a cucleotide repeat region in a nucleic acid molecule characterised by a cucleotide repeat region in a nucleic acid molecule characterised by a nucleotide repeat region in a nucleic acid molecule characterised by a particular in particular, the method is useful for identification of a mucleotide length polymorphism in animals or humans, which is a neucleotide length polymorphism in animals or humans, which is consociated with a neurodegenerative disease including fragile x syndrome, be used for identifying and/or typing microorganisms including yeasts and conservant. And multi-cellular organisms, as well as prokaryotic microorganisms, and for genotyping subjects including humans. The method con peused for genotyping subjects including humans. The method con be used for provide markers for use in identification of human and non-human individuals, plants and identification of human and non-human individuals, plants and contour responses to therapies including the possibility of microorganisms, to ascertain parentage of human or non-human individuals, and to monitor responses to therapies including the possibility of crime, in gene mapping and population studies. LASA may also be used in forensic repeat regions such as a nucleotide length polymorphism in a eukaryotic repeat regions such as a nucleotide length polymorphism in a eukaryotic methods using gel electrophoresis and Southern transfer analysis. In particular, current diagnosis of Huntington's disease relies heavily upon the use of gel electrophoresis, a process that has proved difficult to authored and laboratory procedures. AbK2476-ABK24313 represent primers used to detect polymorphisms or microsatellites as described in the method of the
The invention relates to a substantially purified or isolated nucleic acid (1) from ryegrass or fescue species including a simple sequence cepeat (SSR), having 2 or more tandemly repeated nucleotide core elements 2-6 nucleotides in length. Also included are a nucleic acid primer 2-6 nucleotides in length. Also included are a nucleic acid primer cuitable for amplifying an SSR, identifying (M1) an SSR by preparing a library of ryegrass or fescue genomic DNA enriched for SSRs and identifying clones in the library containing SSRs, a library of ryegrass or fescue genomic DNA enriched for SSRs prepared by the M1, selecting for a gene in grass or cereal breeding by identifying an SSR that is closely associated with the gene such that the SSR and the gene are preferentially co-inherited, and selecting for the SSR in the breeding, a second for DNA profiling grass or cereal species varieties by assessing variation between SSR varieties and testing the purity of grass or cereal seed batches by assessing variation within seed batch of an SSR. The SSRs may be used in the selection of genes in grass or cereal breeding, for profiling grass or cereal seed batches, and for DNA profiling to establish the distinct identity, uniformity and/or stability of a cultivar. The present

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention describes a method of typing (MI) a gene (I) that has one or more polymorphic microsatellite loci (PML). The method comprises: PCR amplification of at least one DMA region of (I) that includes PML, using as template a DMA sample containing at least one segment of (I); and determining the length of the resulting amplicon(s). Also described are: a method of determining (M2) microsatellite markers (MM) for predisposition to a disease, associated with a gene that includes one or more PML; and predisposis (M3) of diseases associated with gene that include PML. The method is used to identify microsatellite markers, in a disease related gene, that are associated with a predisposition to diseases and for prediagnosis of such Myperthermia syndrome in pigs and metabolic diseases; also to type genes that encode milk proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             hormones or transcription factors. The method is simpler, quicker and particularly less expensive than known methods based on sequencing. This sequence represents a prion protein polymorphic microsatellite marker
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Typing genes that contain polymorphic microsatellite loci, useful for identifying predisposition to disease, by amplification and determining length of amplicons.
                                                                                                                                                                                                                                                                                                                                                                  Prion protein polymorphic microsatellite marker consensus sequence #12.

The invention relates to a novel method for selecting highly-dormant wheat using a genetic marker associated with a gene that provides high dormancy to the seeds. In the method of the invention, the genetic marker exists specifically in the genetic region within 44 cM from the gene associated with high dormancy in chromosome 4a. The method is useful for selecting highly-dormant wheat. This polynucleotide sequence represents a
                                                                                     highly-dormant wheat; genetic marker; high dormancy; seed; chromosome 4A;
                                                                                                                                                                                                                                                                                                                                                                                                                                                           Selecting highly-dormant wheat using genetic marker associated with gene
that provides high dormancy to seeds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

                                                                                                                                                                                                                             The sequence is that of a bovine microsatellite sequence obtd, by screening a library of bovine Mbol DNA fragments of between 250 and 500 screening a library of bovine Mbol DNA fragments of between 250 and 500 by with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information for car. 230 such bovine microsatellites is summarised in the sequence upperition and indexed herein (see below). The sequence upstream and downstream of the microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp.

The microsatellite (using the program OPTIPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of the condition in increase the condition is a second or considered the determinism of the condition in the sequence with the sequence of the condition is a second or condition of the condition of the condition or conditions and the determinism of the condition of the con

The sequence is that of a bovine microsatellite sequence obtd. by

creening a library of bovine MboI DNA fragments of between 250 and 500

creening a library of bovine MboI DNA fragments of between 250 and 500

creening a library of bovine MboI DNA fragments of between 250 and 500

creening cross-hybridised. Assuming independent distribution of

microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites

creening genome is estimated at >100, 000. The sequence information

for ca. 230 such bovine microsatellites is summarised in the

specification and indexed herein (see below). The sequences upstream and

creduired PCR primers for in vitro amplification of the corresp.

creduired PCR primers for in vitro amplification of the corresp.

microsatellite (using the program OPTIPRIM). The microsatellites may be

microsatellite (using the program OPTIPRIM). The microsatellites may be

creduited trait loci, or genes involved the determinism of

conomically important traits esp. in cattle, to allow selective

breeding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Detection of polymorphic genetic markers of the form (dC-dA)n(dG-dT)n using novel nucleic acid mols. as primers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Polymorphism; repeat sequence; genetic marker; primer; amplification; PCR; polymerase chain reaction; paternity; maternity; human; pedigree; linkage analysis; genetic disease; animal; plant; breeding; locus;

The sequence is that of a bovine microsatellite sequence obtd. by
screening a library of bovine MboI DNA fragments of between 250 and 500
conservation of a cross-hybridised. Assuming independent distribution of forces cross-hybridised. Assuming independent distribution of microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites
in the bovine genome is estimated at >100, 000. The sequence information of for ca. 230 such bovine microsatellites is summarised in the specification and indexed herein (see below). The sequences upstream and downstream of the microsatellite sequence were used to generate the capuired PCR primers for in vitro amplification of the corresp.

Incrosatellite (using the program OPTIPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of connecting See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                  ö
repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dC-dA). (dG-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AnfeS798-76647. Those clones where the repeat sequence has been determined are shown in AATG5704-797. This repeat sequence is from the marker clone Mdf30 which contains the repeat sequence is from the marker clone Mdf30 which contains the repeat sequence having the formula: (AC)18.5. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Polymorphic bovine DNA markers - used in genetic identification, gene mapping, and selective breeding.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         (AAAA77504-AA7509) generate frameshift mutations. The invention also relates to a method of detecting a polymorphic site in a nucleic acid and a method of detecting a polymorphic site in a nucleic acid and encompasses peptides containing polymorphic sites, antibodies raised against such peptides, and a method of detecting polymorphic sites, antibodies raised against such peptides, and a method of detecting polymorphic gene therapy of an individual having, suspected of having, or at risk of developing a pathological condition due to the presence of a sequence type nucleic acid sequence. Antibodies raised against polymorphic peptides can also be used in the treatment of such individuals
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           which contain single nucleotide polymorphisms (SNPs). Sequences 1 to 1112 AAAA6519-A77429) are consecutive pairs of nucleotides which contain silent SNPs. Sequences 1113 to 1192 (AAA77430-A77509) are consecutive pairs of nucleotides containing SNPs which result in changes in the corresponding amino acid sequences (AAB1749-B1828). The SNPs in sequences 1131 to 1128 (AAA77445) lead to conservative amino acid changes, while those in sequences 1129 to 1186 (AAA77446-A7503) result in non- conservative changes. The SNPs in sequences 1187 to 1192.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human nucleic acids containing single nucleotide polymorphisms, useful for treating a subject suffering, or at risk from a pathology due to the presence of a sequence polymorphism.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequences AAA76318-A77509 represent 1192 human nucleic acid sequences
                                                                                         Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to the isolation of polymorphic repeat sequences having the sequence (dc-dA)n.(dg-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dc-dA).(dg-dT) probe. Over 100 by primers AuT65798-T66047. Those clones where the repeat sequence has been determined are shown in AAT65704-797. This repeat sequence is from the marker clone Mdf52 which contains the repeat sequence is from the marker clone Mdf52 which contains the repeat sequence is from the marker clone Mdf52 which contains the repeat sequence having the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Detection of polymorphic genetic markers of the form (dC-dA) n (dG-dT) n using novel nucleic acid mols. as primers.

The sequence is that of a bovine microsatellite sequence obtd. by

C screening a library of bovine MboI DNA fragments of between 250 and 500

C screening a library of bovine MboI DNA fragments of between 250 and 500

CC opposition and (TC)15 oligonuclocided probe. One out of 50

CC clones cross-hybridised. Assuming independent distribution of

CM in the bovine genome is estimated at >100, 000. The sequence information

CC in the bovine genome microsatellites is summarised in the

Specification and indexed herein (see below). The sequences upstream and

CM downstream of the microsatellite sequence where used to generate the

CC downstream of the microsatellite sequence where used to generate the

CC microsatellite (using the program OPTIPRIM). The microsatellites may be

CC microsatellity individuals, for parentage testing, and in the genetic

CC mapping of economic trait loci, or genes involved the determinism of

CC conformically important traits esp. in cattle, to allow selective

CC find (CC) in the CC) in cattle, to allow selective

CC find (CC) in the CC) in cattle, to allow correct PN

CC find (CC) in the CC) in cattle, to allow correct PN

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine Mool DNA fragments of between 250 and 500 bp with an (AC)15 and a (TC)15 oligomucleotide probe. One out of 50 clones cross-hybridised Assuming independent distribution of microsatellites and Mool sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information for ca. 230 such bovine microsatellites is summarised in the specification and indexed herein (see below). The sequences upstream and downstream of the microsatellites sequence were used to generate the required PCR primers for in vitro amplification of the corresp. microsatellite (using the program OPTIPRIM). The microsatellites may be used to identify individuals, for parentage teeting, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important traits esp. in cattle, to allow selective

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Detecting a nucleotide repeat region in a nucleic acid having a particular length, useful for identifying nucleotide length polymorphism associated with a neurodegenerative disease, comprises using a ligaseassisted spacer addition assay.
                                                                                                                                                                                having the sequence (dd-dd)n. dd-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dd-dd). (dd-df) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AAT65798-T66047. Those clones where the repeat sequence has been determined are shown in AAT65704-797. This repeat sequence has the marker clone Mdf44 which contains the repeat sequence is from the marker clone Mdf44 which contains the repeat sequence is from the marker clone Mdf44 which contains the repeat sequence is from formula: (CA)17. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Microsatellite; ligase-assisted spacer addition assay; LASA; cancer; nucleotide length polymorphism detection; neurodegenerative disease; fragile X syndrome; Huntington's disease; muscular dystrophy; forensic; gene mapping; population study; human; primer; ss.
                                                                                                                                                                      The invention relates to the isolation of polymorphic repeat sequences
                                                                        Detection of polymorphic genetic markers of the form (dC-dA) n (dG-dT) n using novel nucleic acid mols. as primers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

The invention relates to a method of identifying or detecting a nucleotide repeat region in a nucleic acid molecule characterised by a carticular length, comprising employing ligase-assisted spacer addition (LASA) assay. The method is useful in the identifying or detecting a nucleotide repeat region in a nucleic acid molecule characterised by a nucleotide repeat region in a nucleic acid molecule characterised by a condition of particular length. In particular, the method is useful for identification of a nucleotide length polymorphism in animals or humans, which is associated with a neurodegenerative disease including fragile X syndrome, thuntington's disease, or muscular dystrophy. Furthermore, the method may condition and multi-cellular organisms, Purthermore, the method may condition of human and non-human including humans. The method is also useful for detecting oertain cancers and other malignancies.

Condition of human and non-human individuals, plants and identification of human and non-human individuals, plants and identification of human and non-human individuals, plants and identification of human and non-human individuals, plants and complete responses to therapies including the possibility of mucleic acid damage. The nucleotide polymorphisms may be used in forensic condition mapping and population studies lash may also be used in the manufacture of a kit for detecting and/or identifying nucleotide repeat regions such as a nucleotide length polymorphism in a eukaryotic crame, in gene mapping and population studies lash may also be used in crepaat regions such as a nucleotide length polymorphism in a eukaryotic crame. The Lash method avoids the time and cost required by prior art crepaat regions con an alleged perpendent and lasmosis of Huntington's disease relies heaving content diagnosis of Huntington's disease relies heaving content allegenes and laboratory procedures. Askantendent and allows the prior art content diagnosis of maniature say proceded in the energy of miniaturise. The Lash method all

One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites
                                                                                                                markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dc-dA). (dc-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AAT65798-T66047. Those clones where the repeat sequence has the marker clone Mdf47 which contains the repeat sequence is from the marker clone Mdf47 which contains the repeat sequence is from formula: (AC)17.5. (Updated on 25-MAR-2003 to correct PF field.)
                                 Detection of polymorphic genetic markers of the form (dC-dA) n (dG-dT) n - using novel nucleic acid mols. as primers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Polymorphic bovine DNA markers - used in genetic identification, gene mapping, and selective breeding.
                                                                                                                                                                                                                                                                                                                Gaps
                                                                                            The invention relates to the isolation of polymorphic repeat seques having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              PCR; selection; primers; OPTIPRIM; breeding; cattle; parentage; genetic mapping; traits; amplification; ss.

The chromosomal localisation was assigned to the Angelman Syndrome/Prader-Willi Syndrome region at 15q11-13. The dinucleotide repeat was confirmed to be on chromosome 15 by PCR of somatic cell hybrids. (Updated on 25-MAR-2003 to correct PN field.)
in the bovine genome is estimated at >100, 000. The sequence information for ca. 230 such bovine microsatellites is summarised in the specification and indexed herein (see below). The sequences upstream and downstream of the microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp. microsatellite (using the program OPTIPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important traites esp. in cattle, to allow selective breeding.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dC-dA).(dG-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AAT65798-T6647. Those clones where the repeat sequence has been determined are shown in AAT65704-797. This repeat sequence has the marker clone Mdf6 which contains the repeat sequence is from the marker clone Mdf6 which contains the repeat sequence is from the marker clone Mdf6 which contains the repeat sequence having the formula: (CA)5AA(CA)13. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Detection of polymorphic genetic markers of the form (dC-dA) n (dG-dT) n - using novel nucleic acid mols. as primers.

The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Glones containing the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dC-dA). (dG-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AAT65798-T66047. Those clones where the repeat sequence has been determined are shown in AAT65704-797. This repeat sequence is from the marker clone Mdf12 which contains the repeat sequence is from the marker clone Mdf12 which contains the repeat sequence is from formula: (AC)11AT(AC)8A. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                          PCR; polymerase chain reaction; paternity; maternity; human; pedigree;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n. (dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dC-dA). (dG-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AAT65798-T6647. Those clones where the repeat sequence has been determined are shown in AAT65704-797. This repeat sequence has the marker clone Mdf34 which contains the repeat sequence is from the marker clone Mdf34 which contains the repeat sequence as from formula: (AC)AAT(AC)15. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Detection of polymorphic genetic markers of the form (dC-dA) \, n \, (dG-dT) \, n using novel nucleic acid mols. as primers.

```
The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n. (dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the phage libraries were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dC-dA). (dG-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AAT65798-T66047. Those clones where the repeat sequence has been determined are shown in AAT65704-737. This repeat sequence is from the marker clone Mdf42 which contains the repeat sequence is from the marker clone Mdf42 which contains the repeat sequence is from formula: (CA)16T(AC)3.5. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                  Detection of polymorphic genetic markers of the form (dC-dA)n(dG-dT)n using novel nucleic acid mols. as primers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Satellite sequence; DNA fragmentation; microsatellite DNA; DNA marker;

Isolation of satellite sequences from genomic DNA for use as DNA markers comprises isolating a library with high homogeneity by DNA fragmentation.

Example 5; Page 14; 35pp; Japanese.

sequences from genomic DNA that comprises fragmentation of the DNA by a method which is not dependent on base sequences, then selection of the satellite sequences from the obtained genomic library of high homogeneity. The method is useful for the isolation of microsatellite DNA sequences which can be used as DNA markers. The new method markedly improves the efficiency of isolation of satellite sequences in comparison to prior art methods which are reliant on base sequences. Sequences AAZ98483-514 represent sequences from Haliotis discus, used in the method The invention provides a novel method for isolation of satellite of the invention

Detection of polymorphic genetic markers of the form (dC-dA)n(dG-dT)n using novel nucleic acid mols. as primers.

Claim 1; Col 13-14; 186pp; English.

The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of chromosome-specific

phage libraries with a synthetic poly(dc-dA).(dG-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AAT65798-T66047. Those clones where the repeat sequence has been determined are shown in AAT65704-797. This repeat sequence is from the marker clone Mdf105 which contains the repeat sequence having the formula: TCAAACACAA(AC)16. (Updated on 25-MAR-2003 to correct PF field.) 888888888

Kit for diagnozing and treating T-cell associated diseases e.g. autoimmune, degenerative nervous system and infectious disease, comprises nucleic acid primers specifically priming and allowing amplification of a *V*beta gene

Disclosure; SEQ ID NO 797; 164pp; English.

The invention relates to a kit for diagnosing and treating T-cell associated diseases which comprises a panel of nucleic acid primers specifically priming and allowing amplification of each Vbeta gene, VbetaRNA or cDNA. The kit is useful for diagnosing organ transplant rejection and diagnosing and treating T-cell associated diseases including autoimmune diseases, degenerative nervous system diseases, graft versus host disease, hypersensitivity diseases, infectious diseases

                             atrophic gastritis. Degenerative nervous system diseases include multiple sclerosis and Alzheimer's disease. Hypersensitivity diseases include Type I hypersensitivities such as contact with allergens that lead to allergies, Type II hypersensitivities such as those present in Goodpasture's syndrome and Type IV hypersensitivities such as those manifested in leprosy. Infectious diseases include viral infections caused by viruses such as HIV, fungal infections such as those caused by the yeast genus Candida, parasitic infections such as those caused by schicosomes, filaria and bacterial infections such as those caused by Mycobacterium. Neoplastic diseases include lymphoproliferative diseases such as leukaemias, lymphomas and cancers such as cancer of the brain, breast. The present sequence represents a Vbeta gene repeat sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of chromosome specific phage libraries with a synthetic poly(dC-dA). (dG-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AAT65798-T66047. Those clones where the repeat sequence has
   neoplastic diseases. Autoimmune diseases include Addison's disease,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Polymorphism; repeat sequence; genetic marker; primer; amplification; PCR; polymerase chain reaction; paternity; maternity; human; pedigree; linkage analysis; genetic disease; animal; plant; breeding; locus;

The sequence is that of a bovine microsatellite sequence obtd. by
screening a library of bovine MboI DNA fragments of between 250 and 500
corrections and (TC)15 and and mboI sites, the frequency of (T6)n >9 microsatellites
and the bovine genome is estimated at >100, 000. The sequence information
for ca. 230 such bovine microsatellites is summarised in the
specification and indexed herein (see below). The sequences upstream and
downstream of the microsatellite sequence were used to generate the
required PCR primers for in vitro amplification of the corresp.

microsatellite (using the program OPTIPRIM). The microsatellites may be
used to identify individuals, for parentage testing, and in the genetic
mapping of economic trait loci, or genes involved the determinism of
conomically important traits esp. in cattle, to allow selective
breeding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN

CC clones across-Mybridised. Assuming independent distribution of

CC clones across-Mybridised. Assuming independent distribution of

CC microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites

CC for ca. 210 such bovine microsatellites is summarised in the

CC for ca. 210 such bovine microsatellite sequence were used to generate the

CC downstream of the microsatellite sequence were used to generate the

CC downstream of the microsatellite sequence was used to generate the

Microsatellite (using the program OPTIPRIM). The microsatellites may be

microsatellite (using the program OPTIPRIM). The microsatellites may be

CC used to identify individuals, for parentage testing, and in the genetic

CC mapping of economic trait loci, or genes involved the determinism of

CC connomically important traits esp. in cattle, to allow selective

CC breeding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

The invention relates to the isolation of polymorphic repeat sequences having the sequence (dd-dA)n. (dd-dT)n which can be used to detect these markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dd-dA). (dg-dT) probe. Over 100 repeat blocks were isolated. Those clones where amplified by primers AAT65794-76647. Those clones where the repeat sequence has been determined are shown in AAT65704-797. This repeat sequence is from the marker clone Mdf58 which contains the repeat sequence having the formula: (CA)16.5. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Polymorphism; repeat sequence; genetic marker; primer; amplification; PCR; polymerase chain reaction; paternity; maternity; human; pedigree; linkage analyais; genetic disease; animal; plant; breeding; locus; hybridisation; chromosome; ds.

New transgenic mice having a genetically modified fibroblast growth factor receptor gene, useful as a model for human chondrodysplasia, e.g. achondroplasia characterized by shortening of the limbs, midface hypoplasia or large skull.
                                                                                                                                                                                                                                                                                                           The invention relates to an animal model for chondrodysplasia, more particularly, to a transgenic mouse model for achondroplasia. This transgenic mouse contains a fibroblast growth factor receptor 3 (FGFR3) gene including a G to A point mutation changing Gly to Arg in codon 380 in its genome. The transgenic mouse is useful as a model for FGFR-associated chondrodysplasia, particularly FGFR3 achondroplasia, e.g. shortening of the limbs, midface hypoplasia and large skull. This model may be exploited to gain better understanding of the disease and as an experimental model with which experimental therapy to chondrodysplasias can be exercised. The transgenic mouse is particularly useful as a tool for screening, developing and evaluating drugs with a potential of relieving or abolishing chondrodysplasia syndromes and/or symptoms. The present sequence is a PCR primer used to detect mouse FGFR3 allele
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Polymorphic bovine DNA markers - used in genetic identification, gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   PCR; selection; primers; OPTIPRIM; breeding; cattle; parentage; genetic mapping; traits; amplification; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dC-dA). (dG-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AAT65798-T66047. Those clones where the repeat sequence has been determined are shown in AAT65704-797. This repeat sequence has the marker clone Mdf3 which contains the repeat sequence is from formula: (CA)16C. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Mouse; chondrodysplasia; achondroplasia; transgenic mouse; therapy; fibroblast growth factor receptor 3; FGFR3; limb; midface hypoplasia; large skull; drug screening; drug development; transgenic; PCR; primer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n. (dG-dT)n which can be used as genetic
                                                                                                                                                                                                                                                                                                                                                                                                         Detection of polymorphic genetic markers of the form (dC-dA)n(dG-dT)n using novel nucleic acid mols. as primers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                0

The sequence is that of a bovine microsatellite sequence obtd. by

Screening a library of bovine Mool DNA fragments of between 250 and 500

Screening a library of bovine Mool DNA fragments of between 250 and 500

CC clones cross-hybridised. Assuming independent distribution of

CC clones cross-hybridised. Assuming independent distribution of

CC clones across-hybridised. Assuming independent distribution of

CC clones genome is estimated at >100, 000. The sequence information

CC cr ca. 230 such bovine microsatellites is summarised in the

Specification and indexed herein (see below). The sequences upstream and

CC composite of the microsatellite sequence waset to generate the

CC downstream of the microsatellite sequence waset to generate the

CC microsatellite (using the program OPTIPRIM). The microsatellites may be

MICROSATELITY individuals, for parentage testing, and in the genetic

CC mapping of economic trait loci, or genes involved the determinism of

CC conformation trait sep. in cattle, to allow selective

CC preding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct. PN

Detection of polymorphic genetic markers of the form (dC-dA)n(dG-dT)n using novel nucleic acid mols. as primers.

Disclosure; Col 9-10; 186pp; English

The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the

Sequence 34 BP; 17 A; 17 C; 0 G; 0 T; 0 U; 0 Other;

The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n. (dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis of genetic disease, commercial regeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dC-dA). (dG-dT) probe. Over 100 repeat blocks were isolated. Those close where the repeat sequence has by primers AAT65798-76647. Those close where the repeat sequence has been determined are shown in AAT65704-797. This repeat sequence is from the marker close Mdf48 which contains the repeat sequence is from formula: (AC)17. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                  ö
repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dC-dA).(dG-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AAF5798-R66047. Those clones where the repeat sequence has been determined are shown in AAF65704-797. This repeat sequence is from the marker clone Mdf20 which contains the repeat sequence is from formula: (AC)17. (Updated on 25-MAR-2003 to correct PF field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n. (dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dC-dA). (dG-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AAT65798-T66047. Those clones where the repeat sequence has been determined are shown in AAT65704-797. This repeat sequence is from the marker clone Mdf14 which contains the repeat sequence is from formula: (AC)17. (Updated on 25-MAR-2003 to correct PP field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Detection of polymorphic genetic markers of the form (dC-dA) n (dG-dT) n using novel nucleic acid mols. as primers.

                                                                                  repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly (dC-dA). (dG-dT) probe. Over 100 repeat blocks were isolated The inserts from the clones were amplified by primers AAT65798-T66047. Those clones where the repeat sequence has been determined are shown in AAT65704-797. This repeat sequence has the marker clone Mdf101 which contains the repeat sequence is from the marker clone Mdf101 which contains the repeat sequence having the formula: (AC)17. (Updated on 25-MAR-2003 to correct PF field.)
The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ;

                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n. (dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis of containing the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly (dC-dA). (dG-dT) probe. Over 100 repeat blocks were isolated. Those close where the amplified by primers AAT65798-T6647. Those close where the repeat sequence has been determined are shown in AAT65704-797. This repeat sequence is from the marker clone Mdf117 which contains the repeat sequence is from the marker clone Adf117 which contains the repeat sequence having the formula: GCAGCAACAT(AC)16.5. (Updated on 25-MAR-2003 to correct PF
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps .
                                                                                                                                                                                                                                                                                                                                                           Detection of polymorphic genetic markers of the form (dC-dA)n(dG-dT)n using novel nucleic acid mols. as primers.

The sequence is that of a bovine microsatellite sequence obtd. by
conservating a library of bovine MboI DNA fragments of between 250 and 500
conservation of TCD15 oligonucleotide probe. One out of 50
conservation are acrosa-Pybridised. Assuming independent distribution of
conservation are setimated at >100, 000. The sequence information
in the bovine genome is estimated at >100, 000. The sequence information
constraint of the microsatellite sequence where used to generate the
conservation and indexed herein (see below). The sequences upstream and
specification and indexed herein (see below). The sequences upstream and
constream of the microsatellite sequence where used to generate the
microsatellite (using the program OPTIPRIM). The microsatellites may be
microsatellity individuals. for parentage testing, and in the generic
cused to identify individuals. for parentage testing, and in the generic
cused to identify individuals. for parentage testing, and in the generic
cusping of economic trait loci, or genes involved the determinism of
connected program of AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN
prediator.

The invention relates to the identification of nucleic acid molecules (AAI29513-AAI31314) from the human genome which include polymorphic sites which can predispose individuals to disease. Various genes from a number of individuals were resequenced and single nucleotide polymorphisms (SNPs) in these genes discovered. The method is useful for predicting the presence, absence or severity of a particular phenotype or discorder (e.g. diabetes) associated with a particular genotype. The nucleic acids containing the polymorphic sites may be useful in forensics and paternity
                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to the identification of nucleic acid molecules.                                                                                                                                                                                                                                                                                               (AAI29513-AAI31314) from the human genome which include polymorphic sites which can predispose individuals to disease. Various genes from a number of individuals were resequenced and single nucleotide polymorphisms (SNPs) in these genes discovered. The method is useful for predicting the presence, absence or severity of a particular phenotype or disorder (e.g. diabetes) associated with a particular genotype. The nucleic acids containing the polymorphic sites may be useful in forensics and paternity

The kit is useful for diagnosing organ transplant rejection and diagnosing and treating T-cell associated diseases including autoimmune diseases, degenerative nervous system diseases, and neoplastic diseases. Autoimmune diseases include Addison's diseases atrophic gastritis. Degenerative nervous system diseases include multiple sclerosis and Alzheimer's disease. Hypersensitivity diseases include multiple sclerosis and Alzheimer's a contact with allegaes that lead to the part of the scottact with allegaes that lead to the state of the scottact with allegaes that lead to the state of the scottact with allegaes that lead to the state of the scottact with allegaes that lead to the state of the scottact with allegaes that lead to the scottact with allegaes that lead to the state of the seases include Type and the state of the scottact with allegaes that lead to the state of the state of the scottact with allegaes that lead to the state of the scottact with allegaes that lead to the state of the scottact with allegaes that lead to the state of the s

The sequence is that of a bovine microsatellite sequence obtd. by

screening a library of bovine MboI DNA fragments of between 250 and 500

conserved and (TC)15 oligomucleotide probe. One out of 50

conserved arcosa-hybridised. Assuming independent distribution of

microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites

in the bovine genome is estimated at >100, 000. The sequence information

for ca. 230 such bovine microsatellites is summarised in the

specification and indexed herein (see below). The sequences upstream and

specification and indexed herein (see below). The sequences upstream and

compensate of the microsatellite sequence ware used to generate the

downstream of the microsatellite sequence ware used to generate the

required PCR primers for in vitro amplification of the corresp.

microsatellite (using the program OPTIPRIM). The microsatellites may be

microsatellite trait loci, for parentage testing, and in the genetic

cused to identify individuals, for parentage testing, and in the genetic

connomically important traits esp.; in cattle, to allow selective

connomically important traits esp.; in cattle, to allow selective

The sequence is that of a bovine microsatellite sequence obtd. by
screening a library of bovine MboI DNA fragments of between 250 and 500
by with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50
clones cross-hybridised. Assuming independent distribution of
microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites
c in the bovine genome is estimated at >100, 000. The sequence information
for ca. 230 such bovine microsatellites is summarised in the
specification and indexed herein (see below). The sequences upstream and
c specification and indexed herein (see below). The sequences upstream and
c comparteem of the microsatellite sequence were used to generate the
required PCR primers for in vitro amplification of the corresp.
c microsatellite (using the program OPITPRIM). The microsatellites may be
c microsatellite (using the program OPITPRIM). The microsatellites may be
compared to identify individuals, for parentage testing, and in the genetic
mapping of economic trait loci, or genes involved the determinism of
c economically important traits esp. in cattle, to allow selective
preeding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n. (dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of chromosome specific phage libraries with a synthetic poly(dC-dA). (dG-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AAT65798-T66047. Those clones where the repeat sequence has been determined are shown in AAT65704-797. This repeat sequence has the marker clone Mdf108 which contains the repeat sequence laring the formula: GTGGTAAAT(AC)16. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Detection of polymorphic genetic markers of the form (dC-dA) n (dG-dT) n using novel nucleic acid mols. as primers.

The invention relates to the isolation of polymorphic repeat sequences having the sequence (dc-dA)n. (dd-dT)n which can be used to detect these markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the arguences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly (dc-dA). (dg-dT) probe. Over 100 phage libraries with a synthetic poly (dc-dA). (dg-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AAT65798-T66047. Those clones where the repeat sequence has been determined are shown in AAT65704-797. This repeat sequence is from the marker clone Mdf119 which contains the repeat sequence is from the marker clone Mdf119 which contains the repeat sequence is from formula: (AC)16. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Polymorphism; repeat sequence; genetic marker; primer; amplification; PCR; polymerase chain reaction; paternity; maternity; human; pedigree; linkage analysis; genetic disease; animal; plant; breeding; locus;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The sequence is that of a bovine microsatellite sequence obtd. by

screening a library of bovine Mbol DNA fragments of between 250 and 500

co by with an (AC)15 and a (TC)15 oligomucleotide probe. One out of 50

co clones cross-Pybridised. Assuming independent distribution of

co clones cross-Pybridised.

co clones cross-Pybridised.

co microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites

co consumer of the microsatellites is summarised in the

coperation and indexed herein (see below). The sequences upstream and

specification and indexed herein (see below). The sequences upstream and

coperation of the microsatellite sequence where used to generate the

comparing PCR primers for in vitro amplification of the corresp.

concert to identify individuals, for parentage testing, and in the genetic

cused to identify individuals, for parentage testing, and in the genetic

concomically important traits esp. in cattle, to allow selective

encoding at least a portion of the human alpha-7 neuronal nicotinic acetylcholine receptor (alpha-hnAchR). Also described are: (1) a peptide encoded by (1); (2) a vector comprising (1); (3) a host cell transformed with a vector of (2); (4) a polynucleotide comprising at least 15 nucleotides which hybridises under stringent conditions to at least a coption of (1); (5) a method for detection of a polynucleotide encoding alpha 7-hnAchR in a biological sample; and (6) a method for amplification of uncleic acid from a sample suspected of containing nucleic acid nucleic acid from a sample suspected of containing nucleic acid invention can be used on brain tissue and blood samples of humans cuspected of suffering from schizophrenia, small cell lung carcinoma, breast cancer and nicotine-dependent illness. This is particularly useful cordined/diagnosed are epilepsy (e.g. juvenile myoclonic epilepsy) and prader-Willi and Angelman's syndromes The invention provides a novel method for isolation of satellite sequences from genomic DNA that comprises fragmentation of the DNA by a method which is not dependent on base sequences, then selection of the satellite sequences from the obtained genomic library of high homogeneity. The method is useful for the isolation of microsatellite DNA sequences which can be used as DNA markers. The new method markedly improves the efficiency of isolation of satellite sequences in comparison to prior art methods which are reliant on base sequences. Sequences AAZ98483-514 represent sequences from Haliotis discus, used in the method Isolation of satellite sequences from genomic DNA for use as DNA markers comprises isolating a library with high homogeneity by DNA fragmentation. sequence; DNA fragmentation; microsatellite DNA; DNA marker; DB 1; Length 32; Indels Sequence 32 BP; 16 A; 16 C; 0 G; 0 T; 0 U; 0 Other; 1; Score 30.4; DB Pred. Satellite AAZ98487; RESULT 121 AAZ98487, 8\$8888888888888888 음 ઠ ö having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dC-dA).(dG-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AARS798-T6647. Those clones where the repeat sequence has been determined are shown in AAAS5704-797. This repeat sequence has been determined are shown in AAAS5704-797. This repeat sequence is from the marker clone Mdf55 which contains the repeat sequence is from the marker clone Mdf55 which contains the repeat sequence having the formula: (AC)16. (Updated on 25-MAR-2003 to correct PF field.) The invention relates to a method of identifying or detecting a nucleotide repeat region in a nucleic acid molecule characterised by a nucleotide repeat region in a nucleic acid molecule characterised by a comprising employing ligase-assisted spacer addition particular length, comprising employing ligase-assisted spacer addition completed and a nucleic acid molecule characterised by a nucleotide repeat region in a nucleic acid molecule characterised by a conclectide length. In particular, the method is useful for identification of associated with a neurodegenerative disease including fragile X syndrome, associated with a neurodegenerative disease including fragile X syndrome, concept and and/or typing microcrganisms including yeasts and lower uni- and multi-cellular organisms, as well as prokaryotic concept in a slow useful for detecting certain cancers and other malignancies. Moreover, the method can be used to provide markers for use in moreover, the method can be used to provide markers for use in dentification of human and non-human individuals, plants and including the possibility of and to monitor responses to therapies including the possibility of and to monitor responses to therapies including the possibility of and to monitor responses to therapies including the possibility of and crime, in gene mapping and population studies. LASA may also be used in crime, in gene mapping and population studies. LASA may also be used in crime, in gene mapping and population studies. LASA may also be used in crepeat regions such as a nucleotide length polymorphism in a eukaryotic geneat regions such as a nucleotide length polymorphism in a eukaryotic geneat regions such as a nucleotide length polymorphism in a eukaryotic geneat regions such as a nucleotide length polymorphism in a eukaryotic methods using gel electrophoresis and southern transfer analysis. The invention relates to the isolation of polymorphic repeat sequences having the sequence (dd-dA)n. (dd-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Glones containing the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dd-dA). (dg-dT) probe. Over 100 phage libraries with a synthetic poly(dd-dA). (dg-dT) probe. Over 100 repeat blocks were isolated The inserts from the clones were amplified by primers AnfeSy94-r6647. Those clones where the repeat sequence has been determined are shown in AAA65704-797. This repeat sequence is from the marker clone Mdf107 which contains the repeat sequence is from formula: TGCCCGGCCT(AC)16. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                         ö
                    the use of gel electrophoresis, a process that has proved difficult to automate or miniaturise. The LASA method allows total avoidance of this limiting step, making it a strong candidate for future use in clinical and laboratory procedures. ABK24276-ABK24313 represent primers used to detect polymorphisms or microsatellites as described in the method of the

```
The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine MboI DNA fragments of between 250 and 500 by with an (AF)15 and a (TC)15 oligonucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites and mboI sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information for ca. 230 such bovine microsatellites is unmmarised in the specification and indexed herein (see below). The sequences upstream and commitream of the microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp.

The sequired PCR primers for in vitro amplification of the corresp.

The increase of the microsatellite sequence were used to generate the microsatellite (using the program OPTTPRIM). The microsatellites may be microsatellite in vitro ampling of economic trait loci, or genes involved the determinism of economically important trait loci, or genes involved the determinism of preeding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN

rable 7; Page 202; 517pp; English. Polymorphic bovine DNA markers - mapping, and selective breeding.

```
The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine Mbol DNA fragments of between 250 and 500 between 250 and 500 with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites and mbol sites, the frequency of (T6)n >9 microsatellites is estimated at >100,000. The sequence information for ca. 230 such bovine microsatellites is summarised in the specification and indexed herein (see below). The sequences upstream and chowing the microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp.

The microsatellite (using the program OPTIPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important traits esp. in cattle, to allow selective breeding.                                                                                                                                                                                                                                                                                                                                                                                                                                          셤
                                                                                                                                                                                                                                                                    The sequence is that of a bovine microsatellite sequence obtd. by
screening a library of bovine MDOI DNA fragments of between 250 and 500
screening a library of bovine MDOI DNA fragments of between 250 and 500
clones cross-hybridised. Assuming independent distribution of
microsatellites and MDOI sites, the frequency of (T6)n >9 microsatellites
in the bovine genome is estimated at >100,000. The sequence information
for ca. 230 such bovine microsatellites is summarised in the
specification and indexed herein (see below). The sequences upstream and
downstream of the microsatellite sequence water used to generate the
committed PCR primers for in vitro amplification of the corresp.
microsatellite (using the program OPTIPRIM). The microsatellites may be
microsatellite (using the program OPTIPRIM). The microsatellites may be
used to identify individuals, for parentage testing, and in the genetic
mapping of economic trait loci, or genes involved the determinism of
economically important traits egp. in cattle, to allow selective
breeding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN

The sequence is that of a bovine microsatellite sequence obtd. by
screening a library of bovine Mbol DNA fragments of between 250 and 500
corpus cross-hybridised. Assuming independent distribution of
conse cross-hybridised. Assuming independent distribution of
microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites
in the bovine genome is estimated at >100,000. The sequence information
for ca. 330 such bovine microsatellites is summarised in the
specification and indexed herein (see below). The sequences upstream and
specification and indexed herein (see below). The sequences upstream and
committee PCR primers for in vitro amplification of the corresp.
microsatellite (using the program OPTIPRIM). The microsatellites may be
microsatellite (using the program OPTIPRIM). The microsatellites may be
microsatellite (using the program OPTIPRIM). The microsatellites may be
concomically important traits esp. for parentage testing, and in the genetic
economically important traits esp. in cattle, to allow selective
first. Preeding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              g
                                                                                                                                                                The sequence is that of a bovine microsatellite sequence obtd. by
Screening a library of bovine Mbol DNA fragments of between 250 and 500
by with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50
clones cross-hybridised. Assuming independent distribution of
microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites
in the bovine genome is estimated at >100, 000. The sequence information
for ca. 230 such bovine microsatellites is summarised in the
specification and indexed herein (see below). The sequences upstream and
comnstream of the microsatellite sequence were used to generate the
required PCR primers for in vitro amplification of the corresp.
microsatellite (using the program OPTIPRIM). The microsatellites may be
microsatellite (using the program OPTIPRIM). The microsatellites may be
considered to identify individuals, for parentage testing, and in the genetic
mapping of economic trait loci, or genes involved the determinism of
economically important traits esp. in cattle, to allow selective
breading. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine Mbol DNA fragments of between 250 and 500 bp with an (AC)15 and a (TC)15 oligonuclectide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, 000. One out of 50 clone scross-hybridised. Assuming independent distribution of microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information for ca. 230 such bovine microsatellites is summarised in the sepecification and indexed herein (see below). The sequence upstream and downstream of the microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp. microsatellite (using the program OPTIPRIN). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of
for ca. 230 such bovine microsatellites is summarised in the specification and indexed herein (see below). The sequences upstream and downstream of the microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp. microsatellite (using the program OPTIPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important traits esp. in cattle, to allow selective by receding.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n. (dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the phage libraries were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dC-dA). (dG-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AAT65798-T6647. Those clones where the repeat sequence has been determined are shown in AAT65704-797. This repeat sequence is from the marker clone Mdf79 which contains the repeat sequence is from formula: (AC)15.5. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Detection of polymorphic genetic markers of the form (dC-dA)n(dG-dT)n using novel nucleic acid mols. as primers.

Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the animal or plant breeding or pedigree analysis. Clones containing the phage libraries with a synthetic poly(dC-dA). (dG-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AATES/98-T66047. Those clones where the repeat sequence has been determined are shown in AATES/704-797. This repeat sequence has been determined are shown in AATES/704-797. This repeat sequence is from the marker clone Mdf64 which contains the repeat sequence is from the marker clone Mdf64 which contains the repeat sequence is from formula: (AC)15.5. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                          Polymorphism, repeat sequence; genetic marker; primer, amplification;

(AAI29513-AAI31314) from the human genome which include polymorphic sites which can predispose individuals to disease. Various genes from a number of individuals were resequenced and single nucleotide polymorphisms (SNPs) in these genes discovered. The method is useful for predicting the presence, absence or severity of a particular phenotype or disorder (e.g. diabetes) associated with a particular genotype. The nucleic acids containing the polymorphic sites may be useful in forensics and paternity
                                                                                                                                                                                                                                                                                                                         Nucleic acid molecules from the human genome which include polymorphic sites, useful in methods for predicting the presence, absence or severity of a particular phenotype or disorder (e.g. diabetes) associated with a particular genotype.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Polymorphism; repeat sequence; genetic marker; primer; amplification; PCR; polymerase chain reaction; paternity; maternity; human; pedigree; linkage analysis; genetic disease; animal; plant; breeding; locus;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to the identification of nucleic acid molecules

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dC-dA).(dG-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AAT65798-T66047. Those clones where the repeat sequence is from the marker clone Mdf57 which contains the repeat sequence is from the marker clone Mdf57 which contains the repeat sequence is from

repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dc-dA). (dg-dT) probe. Over 100 repeat blocks were isolated The inserts from the clones were amplified ben primare Anfe7579-f6647. Those clones where the repeat sequence has been determined are shown in AAT65704-797. This repeat sequence is from the marker clone Mdf112 which contains the repeat sequence is from the marker clone Mdf112 which contains the repeat sequence having the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  셤
                                                                                                                                                                                                                                                                                                                                                             The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic markers. Parlmers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dC-dA). (dG-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AAT65798-76647. Those clones where the repeat sequence has been determined are shown in AAT65704-797. This repeat sequence is from the marker clone Mdf111 which contains the repeat sequence is from the marker clone Mdf111 which contains the repeat sequence laying the formula: TGAGACCCTG(AC)15.5. (Updated on 25-MAR-2001 to correct PF
                                                                                                                                                                                Detection of polymorphic genetic markers of the form (dC-dA)n(dG-dT)n using novel nucleic acid mols. as primers.

Sequences ABZ43217-ABZ50887 represent polymorphic sites within genes

Claim 23; Page 65; 2785pp; English.

```
to methods and compositions for identifying individuals who have at least one polymorphism in such drug metabolising enzyme-encoding genes. The come polymorphism in such drug metabolising enzyme-encoding genes. The polymorphisms may be identified in a nucleic acid sample using probes or primers specific for a sequence selected from AB24317-AB250887 using a variety of detection assays, including hybridisation assays, nucleic acid arrays and PCR-based methods. The invention also encompasses methods of arrays and PCR-based methods. The invention also encompasses methods of evaluating and screening drugs using genetic polymorphism data, particularly that relating to single nucleotide polymorphisms (SNPs), may be used in studying the relationship between DNA sequence variations and human diseases, conditions, and responses to drugs. SNPs are also useful as polymorphism markers for discovering genes that cause or exacerbate certain diseases. SNPs are particularly useful in the above respects as they are stable in populations, occur frequently, and have lower mutation rates than other genome variations the above respects as they are stable in populations, occur in the above respects as they are stable in populations, occur in the above respects as they are stable in populations, occur in genes encoding drug metabolising enzymes allows the customisation of drug therapies based upon the genesic profile of individual patient.

This would not only take the guessork out of selecting the drug with the greatest therapeutic effect for a particular patient, but would also greates. For example, individuals could be selected for clinical trials only if their genetic profiles individuals and compositions of the invention may therefore lead to an increase in the range of the invention may therefore lead to an increase in the range of possible drug targets and decreases in the number of adverse drug fleeting the inventions, failed drug trials, the time time the or a drug to be approved to take before finding an effectione a driffer
encoding enzymes associated with drug metabolism. The invention relates
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; drug metabolising enzyme; gene; drug metabolism; chromosome 17; polymorphic site; drug evaluation; drug screening; genotyping; genetic profiling; therapeutic customisation; adverse reaction; clinical trial; drug approval; single nucleotide polymorphism; SNP; ds.

Sequences ABZ43217-ABZ50887 represent polymorphic sites within genes encoding enzymes associated with drug metabolism. The invention relates to methods and compositions for identifying individuals who have at least one polymorphism in such drug metabolising enzyme-encoding genes. The cone polymorphisms may be identified in a nucleic acid sample using probes or primers specific for a sequence selected from ABZ4217-ABZS0887 using a variety of detection assays, including hybridisation assays, nucleic acid arrays and PCR-based methods. The invention also encompasses methods of arrays and pCR-based methods. The invention also encompasses methods of arrays and pCR-based methods. The invention also encompasses methods of avaiety of detection assays, including hybridisation assays, nucleic acid arrays and pCR-based methods. The invention also encompasses methods of polymorphism data. particularly that relating to single nucleotide polymorphism data. particularly that relating to single nucleotide polymorphism sequence variations and human diseases, conditions, and responses to drugs. SNPs are also useful as polymorphism markers for discovering genes that cause or exacerbate certain diseases. SNPs are particularly useful in the above respects as they are stable in populations, occur frequently, and have lower mutation rates than other genes with the grue encoding drug metabolising enzymes allows the customisation of drug therapeutic effect for a particular patient. Dut would also reduce the likelihood of adverse reactions, thereby increasing safety. Methods of the invention are also useful in the drug discovery and appropriate patient populations. The methods, data and compositions of the invention may therefore lead to an increase in the range of the invention may therefore lead to an increase in the range of possible drug candidates could be revived if they were matched with more appropriate patient populations. The methods of adverse reactions of adverse reactions of the invention may therefore lead to an increase in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                          Identifying individuals having a polymorphism, useful for determining the effectiveness or side effect of a drug or treatment protocol, comprises detecting at least one polymorphism in the drug metabolizing enzyme
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   reactions, failed drug trials, the time taken for a drug to be approved, the length of time patients are on medication and the number of different medications a patient needs to take before finding an effective therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

                                                                                                                                                                                                                                                                                                                                                                   The sequence is that of a bovine microsatellite sequence obtd. by

screening a library of bovine Mool DNA fragments of between 250 and 500

considerable and (TC)15 oligonucleotide probe. One out of 50

clones cross-bybridised. Assuming independent distribution of

clones cross-bybridised. Assuming independent distribution of

microsatellites and Mool sites, the frequency of (T6)n >9 microsatellites

in the bovine genome is estimated at >100, 000. The sequence information

for ca. 230 such bovine microsatellites is summarised in the

specification and indexed herein (see below). The sequences upstream and

downstream of the microsatellite sequence were used to generate the

cquired PCR primers for in vitro amplification of the corresp.

microsatellite (using the program OPTIPRIM). The microsatellites may be

microsatellite (using the program OPTIPRIM). The microsatellites may be

used to identify individuals, for parentage testing, and in the genetic

capping of economic trait loci, or genes involved the determinism of

connecting See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN

Identifying individuals having a polymorphism, useful for determining the effectiveness or side effect of a drug or treatment protocol, comprises detecting at least one polymorphism in the drug metabolizing enzyme

Claim 23; Page 190; 2785pp; English.

To mecroas and compositions to reneutrying individuals who have at least one polymorphisms may be identified in a nucleic acid sample using probes or primers specific for a sequence selected from ARZ4311-ARZ50887 using a carays and percetion assays, including hybridisation assays, nucleic acid arrays and PCR-based methods. The invention also encompasses methods of arrays and PCR-based methods. The invention also encompasses methods of carays and PCR-based methods. The invention also encompasses methods of carays and PCR-based methods. The invention also encompasses methods of polymorphism data, particularly that relating to single uncleotide polymorphism data, particularly that relating to single nucleotide polymorphism (SNPs), may be used in studying the relationship between the respectate as they are stable in populations, and the respectas as they are stable in populations, occur cause or exacerbate certain diseases. SNPs are particularly useful cause or exacerbate certain diseases. SNPs are particularly useful cauch as repeating sequences. The detection and analysis of polymorphisms of such as repeating sequences. The detection and analysis of polymorphisms could not only take the guesswork out of selecting the drug with the carry therefore the likelihood of adverse reactions, thereby increasing safety. Methods of the invention are also useful in the drug discovery and capproval processes. Por example, individuals could be selected for capable of responding to a particular drug or drug class, and previously called drug candidates could be revived if they were matched with more capable of responding to a particular drug or drug class, and previously called drug candidates could be revived if they were matched with more appropriate patient populations. The methods, data and compositions of the invention may therefore lead to a an increase in the range of the invention may therefore lead to a an increase in the range of capacities and decreases in the mush of a drug capacities of drug candidates and decreases. reactions, failed drug trials, the time taken for a drug to be approved, the length of time patients are on medication and the number of different medications a patient needs to take before finding an effective therapy Sequences ABZ43217-ABZ50887 represent polymorphic sites within genes encoding enzymes associated with drug metabolism. The invention relates to methods and compositions for identifying individuals who have at least

Identifying individuals having a polymorphism, useful for determining the effectiveness or side effect of a drug or treatment protocol, comprises detecting at least one polymorphism in the drug metabolizing enzyme nucleic acid

Claim 23; Page 76; 2785pp; English.

Sequences ABZ43217-ABZ50887 represent polymorphic sites within genes encoding enzymes associated with drug metabolism. The invention relates concethed and compositions for identifying individuals who have at least con emethods and compositions for identifying individuals who have at least con emethods and composition and mucleic acid sample using probes or primers specific for a sequence selected from ABZ43217-ABZ50887 using a variety of detection assays, including hybridisation assays, mucleic acid availety of detection assays, including hybridisation assays, mucleic acid avaiety of detection assays, be used in studying the relations methods of arrays and pCR-based methods. The invention also encompasses methods of arrays and pCR-based methods. The invention also encompasses methods of colymorphisms (SNPs), may be used in studying the relationship between DNA sequence variations and human diseases. SNRs are particularly useful colymorphisms (SNPs), may be used in studying the relationship between DNA sequence variations and human diseases. SNRs are particularly useful in the above respects as they are stable in populations, occur frequently, and have lower mutation rates than other genome variations cut in the above respects as they are stable in populations, occur frequently, and have lower mutation rates than other genome variations in genese encoding drug metabolising enzymes allows the customasation of drug therapies based upon the genetic profile of individual patients.

This would not only take the guesswork out of selection the drug with the greatest therapeutic effect for a particular patient, but would also reduce the likelihood of adverse reactions, thereby individual patient for a particular drug or drug class, and previously the invention may therefore lead to a particular drug or drug class, and previously compable of responding to a particular drug or drug class, and previously reactions, failed drug tradets and decreases in the number of adverse reactions, the emphase and composition are also me

(dG-dT)n which can be used as genetic having the sequence (dC-dA)n. (dG-dT)n which can be used to detect these commercially for use in e.g paternity or maternity testing, human crepeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial can allysis and prefect repeats when analysed, fall into 4 categories: 1) perfect repeats which are alternating tandem CA repeats with no interruptions and without adjacent crepeats of another sequence; 2) imperfect repeats which are defined as 2 consecutive non-repeat bases; 3) compound perfect repeats which are consecutive non-repeat bases; 3) compound perfect repeats which are consecutive non-contrarupted runs of CA separated by no more than 3 consecutive non-consecutive non-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    E CA are interrupted. This sequence is an example of an imperfect sequence of structure: (CA)11CT(CA)4. (Updated on 25-MAR-2003 to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Detection of polymorphic genetic markers of the form (dG-dA) \, n \, (dG-dT) \, n using novel nucleic acid mols. as primers.

The sequence is that of a bovine microsatellite sequence obtd. by coreening a library of bovine Mbol DNA fragments of between 250 and 500 core screening a library of bovine Mbol DNA fragments of between 250 and 500 by with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of 50 clones cross-hybridised. Assuming independent distribution of 60 clones are littles and Mbol sites, the frequency of (TG)n >9 microsatellites of in the bovine genome is estimated at >100, 000. The sequence information for car 230 such bovine microsatellites is summarised in the microsatellite sequence were used to generate the correct of the microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp.

The microsatellite (using the program OPTIPRIM). The microsatellites may be consomic trait loci, or genes involved the determinism of economically important traits esp. in cattle, to allow selective breeding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dC-dA). (dG-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AAT65798-T6647. Those clones where the repeat sequence has been determined are shown in AAT65704-797. This repeat sequence has the marker clone Mdfill Which contains the repeat sequence is from the marker clone Mdfill which contains the repeat sequence aving the formula: (AC)15. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Simple sequence repeat; plant; ds; SSR; ryegrass; fescue; tandem repeat; cereal profiling; grass profiling; seed batch purity testing.

The invention relates to a substantially purified or isolated nucleic acid (I) from ryegrass or fescue species including a simple sequence core decide (SSR), having 2 or more tandemly repeated nucleotide core elements 2-6 nucleotides in length. Also included are a nucleic acid primar cutable for amplifying an SSR, identifying (MI) an SSR by preparing a library of ryegrass or fescue genomic DNA enriched for SSRs and identifying clones in the library containing SSRs, a library of ryegrass or fescue genomic DNA enriched for SSRs prepared by the MI, selecting for a gene in grass or cereal breeding by identifying an SSR that is closely a ssociated with the gene such that the SSR and the gene are contained for DNA profiling grass or cereal species varieties by assessing contained for DNA profiling grass or cereal species varieties by assessing variation within seed batch of an SSR. The SSRs can be used in the selection of genes in grass or cereal breeding, for profiling grass or cereal species varieties, for testing the purity of grass or cereal species varieties, for testing the purity of grass or cereal species varieties, for testing the purity of grass or cereal species varieties, for testing the purity of grass or cereal species varieties, for testing the purity of grass or cereal species varieties, for testing the purity of grass or cereal species varieties, for testing the printy of grass or cereal species varieties, for testing the printy of grass or cereal species varieties, for testing the printy of grass or cereal species varieties, for testing the printy of grass or cereal species varieties, for testing the printy of grass or cereal species varieties, for testing the printy of grass or cereal species varieties, for testing the printy of sequence is a ryegrass or fescue SSR
                                                                                                                                                                                                                                                                                                   New simple sequence repeats having 2 or more tandemly repeated nucleotide core elements isolated from ryegrass and fescue, useful for selecting of genes in grass or cereal breeding or profiling grass or cereal species
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Simple sequence repeat, plant, ds, SSR; ryegrass, fescue; tandem repeat, cereal profiling, grass profiling; seed batch purity testing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

```
The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine MboI DNA fragments of between 250 and 500 bp with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information for ca. 230 such bovine microsatellites is summarised in the sequence information for ca. 210 such bovine microsatellite see low). The sequences upstream and downstream of the microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp.
                                                                                                              new microsatellite DNA derived from a Pyrus plant and discrimination of
                                                                                                                                                                                                                                                                           Pyrus plants. The invention also comprises a method for discriminating Pyrus plants - utilising the novel Pyrus microsatellite DNA. The novel microsatellite DNA sequence can be used in discriminating Pyrus plants.
                                                                                                                                                                                                                                                                                                                                                                     The present DNA sequence represents a probe specific for a novel Pyrus pyrifolia (sand pear) microsatellite DNA sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Polymorphic bovine DNA markers - used in genetic identification, gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     PCR; selection; primers; OPTIPRIM; breeding; cattle; parentage; genetic mapping; traits; amplification; 88.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           0.7%; Score 28.4; DB 1; Length 30; 96.7%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a substantially purified or isolated nucleic acid (I) from ryegrass or fescue species including a simple sequence repeat (SSR), having 2 or more tandemly repeated nucleotide core elements 2-6 nucleotides in length. Also included are a nucleic acid primer suitable for amplifying an SSR, identifying (M1) an SSR by preparing a library of ryegrass or fescue genomic DNA enriched for SSRs and clentifying clones in the library containing SSRs, a library of ryegrass or fescue genomic DNA enriched for SSRs prepared by the M1, selecting for a gene in grass or cereal breeding by identifying an SSR that is closely associated with the gene such that the SSR and the gene are preferentially co-inherited, and selecting for the SSR in the breeding, a method for DNA profiling grass or cereal species varieties by assessing.

Containing prass or cereal species and testing the purity of grass or cereal seed batches by assessing varieties and testing the purity of grass or cereal species varieties, for testing the purity of grass or cereal species varieties, for testing the purity of grass or cereal species varieties, for testing the purity of grass or cereal species varieties, for testing the purity of grass or cereal species varieties, for testing the purity of grass or cereal species varieties, for testing the purity of grass or cereal species varieties, for testing the purity of grass or cereal species varieties, for testing the purity of grass or cereal species varieties, for testing the purity of grass or cereal species varieties, for testing the purity of grass or cereal species varieties, for testing the purity of grass or cereal species varieties, and for DNA profiling to establish the grass or cereal species varieties, and cereal present the present present processed to the processed to the present present processed to the pre

The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine MboI DNA fragments of between 250 and 500 by with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information for ca. 230 such bovine microsatellites is summarised in the sequence information for ca. 230 such bovine microsatellite sequence were used to generate the sequired PCR primers for in vitro amplification of the corresp.

The proposed PCR primers for in vitro amplification of the corresp.

The country of economic trait loci, or genes involved the determinism of economic trait loci, or genes involved the determinism of economic trait seps. in cattle, to allow selective breeding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN
                mapping of economic trait loci, or genes involved the determinism of economically important traits esp. in cattle, to allow selective breeding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN

by with an (AC)15 and a (TC)15 oligonuclectide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of clones cross-hybridised. Assuming independent distribution of microsatellites and Mboi sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information for ca. 230 such bovine microsatellites is summarised in the sequence information specification and indexed herein (see below). The sequence information downstream of the microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp.

Used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of breeding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN

The sequence is that of a bovine microsatellite sequence obtd, by screening a library of bovine Mbol DNA fragments of between 250 and 500 screening a library of bovine Mbol DNA fragments of between 250 and 500 close cross-hybridised. Assuming independent distribution of microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information in the bovine microsatellites is summarised in the genefication and indexed herein (see below). The sequences upstream and downstream of the microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp.

In increasellite (Using the program OPTIPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of the content trait sep. in cattle, to allow selective contents of the content trait sep. in cattle, to allow selective contents and the contents of the content trait sep. in cattle, to allow selective contents and contents of the conten
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         economically important traits esp. in cattle, to allow selective breeding.
